

# The mechanics of 1\_download.R

Addison Larson

1/25/2019

## Setup

## Dependencies

```
require(tidycensus); require(tidyverse); require(here)
```

## Functions

1. For a given vector of numbers `x` and a number of bins `i`, `st_dev_breaks` computes the bin breaks starting at  $-0.5 \cdot stdev$  and  $0.5 \cdot stdev$ . For the purposes of IPD analysis, `i = 5`, and `st_dev_breaks` calculates the minimum,  $-1.5 \cdot stdev$ ,  $-0.5 \cdot stdev$ ,  $0.5 \cdot stdev$ ,  $1.5 \cdot stdev$ , and maximum values. These values are later used to slice the vector into five bins.
2. `move_last` moves a column or vector of columns to the last position in a tibble or data frame.

```
st_dev_breaks <- function(x, i, na.rm = TRUE){
  half_st_dev_count <- c(-1 * rev(seq(1, i, by = 2)),
                        seq(1, i, by = 2))
  if((i %% 2) == 1) {
    half_st_dev_breaks <- unlist(lapply(half_st_dev_count,
                                        function(i) (0.5 * i * sd(x, na.rm = TRUE)) +
                                        mean(x, na.rm = TRUE)))
    half_st_dev_breaks[[1]] <- ifelse(min(x, na.rm = TRUE) < half_st_dev_breaks[[1]],
                                     min(x, na.rm = TRUE), half_st_dev_breaks[[1]])
    half_st_dev_breaks[[i + 1]] <- ifelse(max(x, na.rm = TRUE) > half_st_dev_breaks[[i + 1]],
                                         max(x, na.rm = TRUE), half_st_dev_breaks[[i + 1]])
  } else {
    half_st_dev_breaks <- NA
  }
  return(half_st_dev_breaks)
}
move_last <- function(df, last_col) {
  match(c(setdiff(names(df), last_col), last_col), names(df))
}
```

## Downloads

### API Calls for counts (universes and estimates)

Download all necessary tables for count data for IPD's nine indicators. Below is a brief overview of the indicators, abbreviations used in data processing, and ACS 5-Year Estimate source tables.

| Indicator | Abbreviation | Table  |
|-----------|--------------|--------|
| Youth     | Y            | B09001 |

| Indicator                   | Abbreviation | Table  |
|-----------------------------|--------------|--------|
| Older Adults                | OA           | S1601  |
| Female                      | F            | S0101  |
| Racial Minority             | RM           | B02001 |
| Ethnic Minority             | EM           | B03002 |
| Foreign-Born                | FB           | B05012 |
| Limited English Proficiency | LEP          | S1601  |
| Disabled                    | D            | S1810  |
| Low-Income                  | LI           | S1701  |

Note two exceptions embedded in processing:

1. The API does not allow redundant downloads, so universes for Youth and Limited English Proficiency are duplicated after download.
2. This API call downloads variable B02001\_002 (“Estimate; Total: - White alone”) as the count, when the desired variable for Racial Minority is technically B02001\_001 – B02001\_002, aka the universe minus the estimate. This is computed after download, making a correct estimate and an incorrect MOE.

```
s_counts <- get_acs(geography = "tract", state = c(34,42), output = "wide",
  variables = c(LI_U = "S1701_C01_001",
    LI_C = "S1701_C01_042",
    F_U = "S0101_C01_001",
    F_C = "S0101_C03_001",
    D_U = "S1810_C01_001",
    D_C = "S1810_C02_001",
    OA_U = "S1601_C01_001",
    # LEP_U = "S1601_C01_001", # Redundant download
    LEP_C = "S1601_C05_001")) %>%
  select(-NAME) %>% mutate(LEP_UE = OA_UE, LEP_UM = OA_UM)
d_counts <- get_acs(geography = "tract", state = c(34,42), output = "wide",
  variables = c(EM_U = "B03002_001",
    EM_C = "B03002_012",
    # Y_U = "B03002_001", # Redundant download
    Y_C = "B09001_001",
    FB_U = "B05012_001",
    FB_C = "B05012_003",
    RM_U = "B02001_001",
    RM_C = "B02001_002")) %>%
  mutate(Y_UE = EM_UE, Y_UM = EM_UM, x = RM_UE - RM_CE) %>%
  select(-NAME, -RM_CE) %>%
  rename(RM_CE = x)
dp_counts <- get_acs(geography = "tract", state = c(34,42), output = "wide",
  variables = c(OA_CE = "DP05_0025E")) %>%
  rename(OA_CM = DP05_0025M) %>% select(-NAME)
```

## API Calls for counts (universes and estimates)

Download percentage tables that are available for three of IPD’s nine indicators. We will compute percentages and their associated MOEs for the rest of the dataset later.

| Indicator    | Abbreviation | Table |
|--------------|--------------|-------|
| Older Adults | OA           | S0101 |

| Indicator                   | Abbreviation | Table |
|-----------------------------|--------------|-------|
| Female                      | F            | DP05  |
| Limited English Proficiency | LEP          | S1601 |
| Disabled                    | D            | S1810 |

```
s_percs <- get_acs(geography = "tract", state = c(34,42), output = "wide",
  variables = c(D_P = "S1810_C03_001",
    OA_P = "S0101_C01_028",
    LEP_P = "S1601_C06_001")) %>% select(-NAME)
dp_percs <- get_acs(geography = "tract", state = c(34,42), output = "wide",
  variables = c(F_P = "DP05_0003PE")) %>%
  rename(F_PE = F_P, F_PM = DP05_0003PM) %>% select(-NAME)
```

## Combine downloads into merged files

Merge downloads into two separate data frames: `dl_counts` for counts and universes, and `dl_percs` for available percentages. Subset data frames for DVRPC's nine-county region.

```
keep_cty <- c("34005", "34007", "34015", "34021", "42017", "42029", "42045", "42091", "42101")
dl_counts <- left_join(s_counts, d_counts) %>%
  left_join(., dp_counts) %>%
  filter(str_sub(GEOID, 1, 5) %in% keep_cty)
dl_percs <- left_join(s_percs, dp_percs) %>%
  filter(str_sub(GEOID, 1, 5) %in% keep_cty)
```

## Calculations

Split `dl_counts` into a list named `comp` for processing and sort column names for consistency. The order of columns will be important because processing is based on vector position. The name of the list, `comp`, is a nod to the “component parts” of `dl_counts`. For all nine indicators:

1. Compute percentages and associated MOEs
2. Compute percentile
3. Compute IPD score and classification
4. Compute total IPD score across all nine indicators

```
comp <- list()
comp[[1]] <- dl_counts %>% select(ends_with("UE")) %>% select(sort(current_vars()))
comp[[2]] <- dl_counts %>% select(ends_with("UM")) %>% select(sort(current_vars()))
comp[[3]] <- dl_counts %>% select(ends_with("CE")) %>% select(sort(current_vars()))
comp[[4]] <- dl_counts %>% select(ends_with("CM")) %>% select(sort(current_vars()))
```

## Compute percentages and associated MOEs

### Calculation

MOEs of the percentage values are obtained using the `tidycensus` function `moe_prop`.

```
pct_matrix <- NULL
pct_moe_matrix <- NULL
```

```

for (m in 1:length(comp[[1]])){
  pct <- unlist(comp[[3]][,m] / comp[[1]][,m] * 100)
  pct <- round(pct, digits = 3)
  pct_matrix <- cbind(pct_matrix, pct)
  moe <- NULL
  for (l in 1:length(comp[[1]]$LI_UE)){
    moe_indiv <- as.numeric(moe_prop(comp[[3]][l,m],
                                     comp[[1]][l,m],
                                     comp[[4]][l,m],
                                     comp[[2]][l,m])) * 100

    moe_indiv <- round(moe_indiv, digits = 3)
    moe <- append(moe, moe_indiv)
  }
  pct_moe_matrix <- cbind(pct_moe_matrix, moe)
}

```

## Result

pct and pct\_moe stores the percentages and associated MOEs for the nine indicator variables.

```

pct <- as_tibble(pct_matrix)
names(pct) <- str_replace(names(comp[[1]]), "_UE", "_PctEst")
pct_moe <- as_tibble(pct_moe_matrix)
names(pct_moe) <- str_replace(names(comp[[1]]), "_UE", "_PctMOE")

```

## Exception 1

If estimated percentage == 0 & MOE == 0, then make MOE = 0.1.

Matrix math: Only overwrite MOE where pct\_matrix + pct\_moe\_matrix == 0.

```

overwrite_locations <- which(pct_matrix + pct_moe_matrix == 0, arr.ind = TRUE)
pct_moe[overwrite_locations] <- 0

```

## Exception 2

Substitute percentages and associated MOEs when available from American FactFinder. This applies to the Older Adults, Female, Limited English Proficiency, and Disabled variables.

```

pct <- pct %>% mutate(D_PctEst = dl_percs$D_PE,
                     OA_PctEst = dl_percs$OA_PE,
                     LEP_PctEst = dl_percs$LEP_PE,
                     F_PctEst = dl_percs$F_PE)
pct_moe <- pct_moe %>% mutate(D_PctMOE = dl_percs$D_PM,
                             OA_PctMOE = dl_percs$OA_PM,
                             LEP_PctMOE = dl_percs$LEP_PM,
                             F_PctMOE = dl_percs$F_PM)

```

## Exception 3

To be added. Use variance replicates to compute RM\_CntMOE and RM\_PctMOE.

## Compute percentile

### Calculation

Add percentages to `comp`, making sure to first sort column names for consistency. Compute the empirical cumulative distribution function for each of the nine indicator variables.

```
comp[[5]] <- pct %>% select(sort(current_vars()))
percentile_matrix <- NULL
for (m in 1:length(comp[[1]])){
  p <- unlist(comp[[5]][,m])
  rank <- ecdf(p)(p) * 100
  rank <- round(rank, digits = 3)
  percentile_matrix <- cbind(percentile_matrix, rank)
}
```

### Result

`percentile` stores the percentile rank for the nine indicator variables.

```
percentile <- as_tibble(percentile_matrix)
names(percentile) <- str_replace(names(comp[[1]]), "_UE", "_Rank")
```

## Compute IPD score and classification

Each observation is assigned an IPD score for each indicator. The IPD score for an individual indicator can range from 0 to 4, which corresponds to the following:

| IPD Score | IPD Classification | Standard Deviations  |
|-----------|--------------------|----------------------|
| 0         | Well Below Average | $s \leq -1.5$        |
| 1         | Below Average      | $-1.5 < s \leq -0.5$ |
| 2         | Average            | $-0.5 < s \leq 0.5$  |
| 3         | Above Average      | $0.5 < s \leq 1.5$   |
| 4         | Well Above Average | $s > 1.5$            |

Note an exception buried in processing:

1. If the estimated percentage for an observation == 0 and this observation also falls in Bin 1, move to Bin 0. Locations where this exception apply are stored in `overwrite_locations`.

```
score_matrix <- NULL
class_matrix <- NULL
for (m in 1:length(comp[[1]])){
  p <- unlist(comp[[5]][,m])
  breaks <- st_dev_breaks(p, 5, na.rm = TRUE)
  score <- (cut(p, labels = FALSE, breaks = breaks,
               include.lowest = TRUE, right = TRUE)) - 1
  overwrite_locations <- which(score == 0 & p == 0)
  score[overwrite_locations] <- 0
  class <- case_when(score == 0 ~ "Well Below Average",
                    score == 1 ~ "Below Average",
                    score == 2 ~ "Average",
```

```

      score == 3 ~ "Above Average",
      score == 4 ~ "Well Above Average")
score_matrix <- cbind(score_matrix, score)
class_matrix <- cbind(class_matrix, class)
}

```

## Result

score and class store the IPD scores and associated descriptions for the nine indicator variables.

```

score <- as_tibble(score_matrix)
names(score) <- str_replace(names(comp[[1]]), "_UE", "_Score")
class <- as_tibble(class_matrix)
names(class) <- str_replace(names(comp[[1]]), "_UE", "_Class")

```

## Compute total IPD score across all nine indicators

Sum the IPD scores for the nine indicator variables to determine the overall IPD score.

```
score <- score %>% mutate(IPD_Score = rowSums(.))
```

## Cleaning

Merge all information into a single data frame called df.

```

df <- bind_cols(dl_counts, pct) %>%
  bind_cols(., pct_moe) %>%
  bind_cols(., percentile) %>%
  bind_cols(., score) %>%
  bind_cols(., class)

```

Rename columns.

```

names(df) <- str_replace(names(df), "_CE", "_CntEst")
names(df) <- str_replace(names(df), "_CM", "_CntMOE")
df <- df %>% mutate(U_TPopEst = F_UE, U_TPopMOE = F_UM, U_Pop6Est = LEP_UE,
                  U_Pop6MOE = LEP_UM, U_PPovEst = LI_UE, U_PPovMOE = LI_UM,
                  U_PNICEst = D_UE, U_PNICMOE = D_UM) %>%
  select(-ends_with("UE"), -ends_with("UM"))

```

Reorder columns.

```

df <- df %>% select(GEOID, sort(current_vars())) %>%
  select(move_last(., c("IPD_Score", "U_TPopEst", "U_TPopMOE", "U_Pop6Est",
                      "U_Pop6MOE", "U_PPovEst", "U_PPovMOE", "U_PNICEst", "U_PNICMOE")))

```

Replace NA values with NoData if character and -99999 if numeric.

```

df <- df %>% mutate_if(is.character, funs(ifelse(is.na(.), "NoData", .))) %>%
  mutate_if(is.numeric, funs(ifelse(is.na(.), -99999, .)))

```

Export result.

```
write_csv(df, here("outputs", "ipd.csv"))
```
